

New Horizons SDC PDS Review

Addie Dove
Oct 2018

Student Dust Counter

- SDC is an impact dust detector - goal was to measure the spatial distribution and size of dust along the trajectory of NH throughout the solar system
- PVDF films generate a depolarization electrical signal when a dust particle impacts the surface.
- 14 “channels”, although 1 and 14 are inactive for calibration, channel 11 failed before launch
- Signals are measured as a data number (DN) in the raw data, this is converted to charge and mass via calibration functions that have been improved since the start of the mission by testing on the ground engineering unit.
 - Masses calculated by assuming a velocity of an impacting dust particle to be on a Keplerian orbit at the location of impact.
 - In theory, SDC is capable of detecting particles with masses $m > 10^{-12}$ g, although thresholds for detection vary through mission
 - Smaller particles “detected” by integration of signal over time

KEM data overview

- The extended mission (KEM) shall go from 2016-10-26 to 2021-09-30
 - KEM Cruise 1 is from 2016-10-26 to 2018-08-14
 - This dataset includes data until 2017-12-17
- Overall, no significant changes to the documentation or the dataset, other than updates for the new mission phase
- Most documentation accurately reflects this (see few typos, issues listed below)
- **Interesting note** (/catalog/dataset.cat):

When considering this data set, note that the SDC channel thresholds were increased to their 'high' settings starting on 9/21/2017 (or 39.5 AU) due to unexpected noise following instrument testing for the MU-69 encounter.

 - which instrument testing? stimulated calibration (document/sdc_stim_v0002.tab) lists the last stimulated calibration as 2016-07-08.
 - what are the downstream implications for this? is the detector just not sensitive anymore?
 - related: engineering (level2) dataset on 20170921 has a *large* number of files, some of which are only a couple of data points, showing the fluctuations and then increase in the threshold level

Same problem as seen in previous review: duplicate entries

- two datasets for the same time periods from 20170403-20170912 and 20171022-20171118
- from slimindx.tab:

`/documents/sdcram.csv`

- new file - not in other datasets?
- provides a table of the general pointing direction of the NH s/c at different times, to emphasize when the s/c is pointing in the ram direction, when you would suspect that impact signals would be real
- should be used to verify the validity of dust “detections”?
- no other references to this document in other parts of the dataset, however
 - probably not used for the level 3 product, but should be carefully considered for any analysis

Availability of ancillary data

- Inconsistencies in timing, length of included data within the data files
 - nominal included data goes until 2017-12-17
- In both level 2 & 3
 - documents/sdcram only goes until 2016-12-31
 - documents/sdc_on_off_times_v0830.tab (and _alt.tab) only until 2017-01-24
 - documents/sdc_on_off_cmd_v001.tab (and _alt.tab) only until 2016-10-16
 - documents/sdc_on_3d_v0830.tab only until 2017-01-21
 - documents/sdc_off_3d_v0380.tab only until 2016-10-19
 - mission trajectory listed until 2017-12-31 (good!)

Mission Overview

=====

The New Horizons Kuiper Belt Extended Mission is a mission to a recently discovered, unexplored region of the solar system, the Kuiper Belt (KB). The centerpiece of the mission is a close flyby of Kuiper Belt Object (KBO) 2014 MU69. The mission will also aggressively survey the KB using NH as an observatory, examining many other Kuiper Belt Objects and Centaurs while studying the Kuiper Belt dust, gas, plasma, and energetic particle environments. Doing so will place both 2014 MU69 and the Pluto system in better context among KBOs, increasing scientific understanding of both.

Characterize regolith scattering properties of MU69 and any satellites and rings.

Issues seen in both sdc-2 and sdc-3

- 3) Two counter fields indicating the power state of the SDC instrument:
- 4) Two fields comprising max and min the angle between the SDC detector normal vector and the ram direction vector, over the sixty samples.
- 4) Two fields comprising the range (minimum and maximum values) of the angles between the SDC detector normal vector and the ram direction vector, as calculated over the sixty samples.

Awkward sentence:

Subtleties, such as how much the ram direction is from pointing directly away from the Sun, are ignored.

```
OBJECT          = FIELD
NAME            = "MINIMUM SDC BORE-RAM ANGLE"
FIELD_NUMBER   = 9
BYTES          = 7
DATA_TYPE      = "ASCII_REAL"
FORMAT         = "F7.2"
UNIT           = "DEGREES"
INVALID_CONSTANT = -999.00
DESCRIPTION    = "This field provides the minimum value of the
                  angle between the SDC boresight and the ram
                  direction.  As long as one or more samples
                  were successfully calculated, this value will
                  range from 0.00 to 180.00.  For rows occurring
                  during large gaps in the time coverage of the
                  available SPICE C-Kernels, there may be no
                  successful results, the COOUNTER FOR
                  UNKNOWN ANGULAR VELOCITY field (FIELD_NUMBER
                  6) will be 60, and this field will have the
                  INVALID_CONSTANT value of -999.00.

                  The calculation of the boresight-ram angle
                  using SPICE C-Kernels; refer to the NH SPICE
                  data set [NH-J/P/SS-SPICE-6-V1.0] for more
                  details.
                  "
END_OBJECT      = FIELD
```

should read MAXIMUM

```
OBJECT          = FIELD
NAME            = "MINIMUM SDC BORE-RAM ANGLE"
FIELD_NUMBER   = 10
BYTES          = 7
DATA_TYPE      = "ASCII_REAL"
FORMAT         = "F7.2"
UNIT           = "DEGREES"
INVALID_CONSTANT = -999.00
DESCRIPTION    = "This field provides the maximum value of the
                  angle between the SDC boresight and the ram
                  direction.  As long as one or more samples
                  were successfully calculated, this value will
                  range from 0.00 to 180.00.  For rows occurring

`nh-x-sdc-2-kemcruise1-v1.0/document/sdc_off_3d_v0830.lbl`
`nh-x-sdc-2-kemcruise1-v1.0/document/sdc_on_3d_v0830.lbl`

This table includes only only those time periods with a duration of at least three days. This was requested by the reviewers during the peer review of this data set.

`nh-x-sdc-2-kemcruise1-v1.0/document/sdc_on_off_cmd_v0001.lbl`
`nh-x-sdc-2-kemcruise1-v1.0/document/sdc_on_off_cmd_v0001_alt.lbl`

Repeated phrasing:

The ordering of events in this file is by time, then channel number.

This INCLUDES ONLY those events initiated by spacecraft commanding.

This EXCLUDES those events initiated by SDC autonomy.

The ordering of events in this file is by time, then channel number.
